Operations on languages

Let $A, B \subseteq \Sigma^*$ be languages. Define

Regular Operations {

- Union: $A \cup B$
- Concatenation: $A \circ B = \{ab \mid a \in A, b \in B\}$
- Star: $A^* = \{a_1 a_2 \dots a_n \mid n \geq 0 \text{ and } a_i \in A\}$
- Complement: \bar{A}
- Intersection: $A \cap B$
- Reverse: $A^R = \{a_1 a_2 \dots a_n \mid a_n \dots a_1 \in A\}$

Theorem: The class of regular languages is **closed** under all six of these operations

Assignment Project Exam Help

Proving Closure Properties

<https://powcoder.com>

Add WeChat powcoder

Complement

Complement: $\bar{A} = \{ w \mid w \notin A \}$

Theorem: If A is regular, then \bar{A} is also regular

Proof idea:

Assignment Project Exam Help

Add WeChat powcoder

Complement, Formally

Let $M = (Q, \Sigma, \delta, q_0, F)$ be a DFA recognizing a language A . Which of the following represents a DFA recognizing \bar{A} ?

- a) $(F, \Sigma, \delta, q_0, Q)$
- b) $(Q, \Sigma, \delta, q_0, Q \setminus F)$, where $Q \setminus F$ is the set of states in Q that are not in F
- c) $(Q, \Sigma, \delta', q_0, F)$ where $\delta'(q, s) = p$ such that $\delta(p, s) = q$
- d) None of the above

Closure under Concatenation

Concatenation: $A \circ B = \{ xy \mid x \in A, y \in B \}$

Theorem. If A and B are regular, $A \circ B$ is also regular.

Proof idea: Given DFAs M_A and M_B , construct NFA by

- Connecting all accept states in M_A to the start state in M_B .
- Make all states in M_A non-accepting.

Closure under Concatenation

Concatenation: $A \circ B = \{ xy \mid x \in A, y \in B \}$

Theorem. If A and B are regular, $A \circ B$ is also regular.

Proof idea: Given DFAs M_A and M_B , construct NFA by

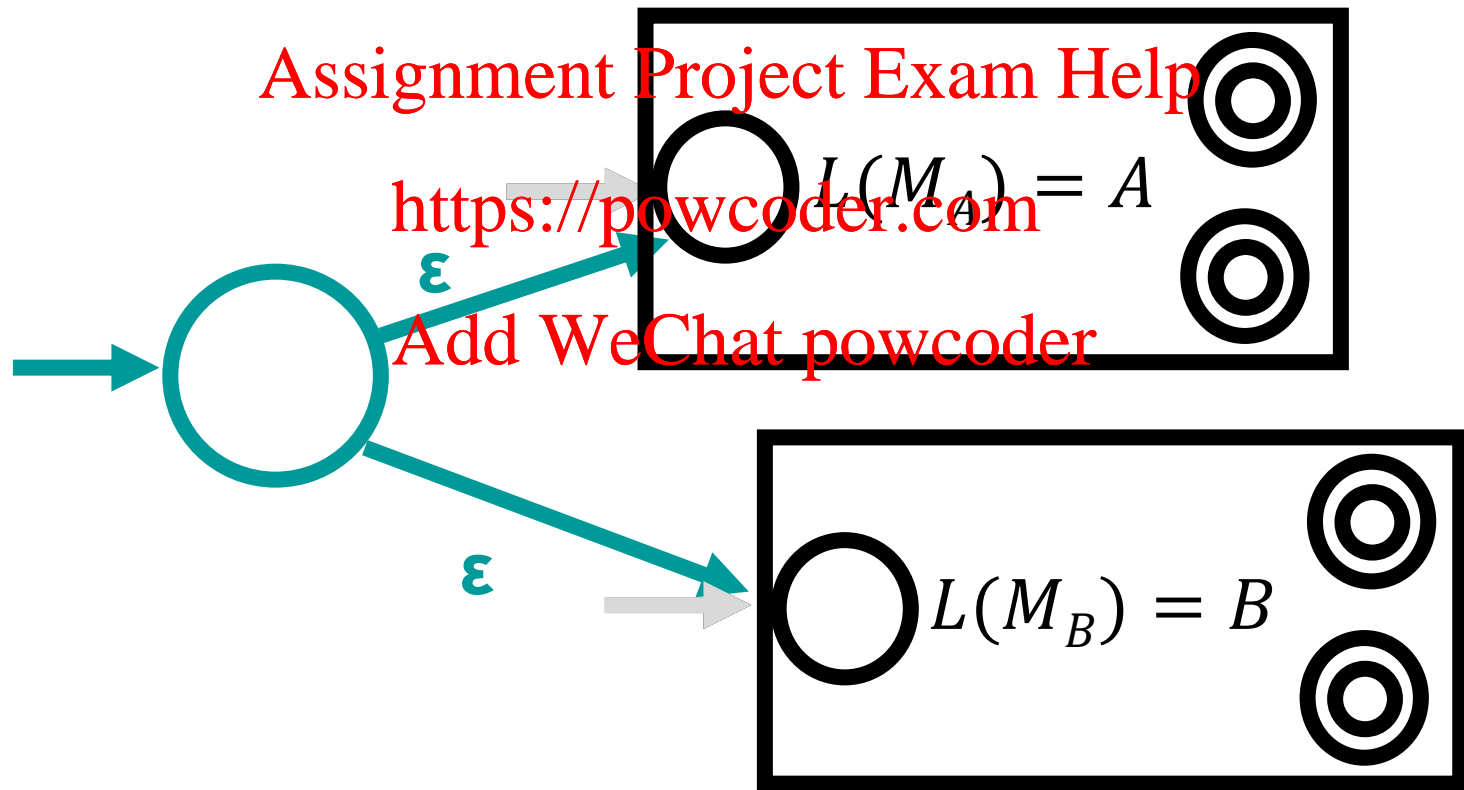

- Connecting all accept states in M_A to the start state in M_B .
- Make all states in M_A non-accepting.

A Mystery Construction

Given DFAs M_A recognizing A and M_B recognizing B , what does the following NFA recognize?

Closure under Star

Star: $A^* = \{ a_1 a_2 \dots a_n \mid n \geq 0 \text{ and } a_i \in A \}$

Theorem. If A is regular, A^* is also regular.

Assignment Project Exam Help

Closure under Star

Star: $A^* = \{ a_1 a_2 \dots a_n \mid n \geq 0 \text{ and } a_i \in A \}$

Theorem. If A is regular, A^* is also regular.

On proving your own closure properties

You'll have homework/test problems of the form “show that the regular languages are closed under some operation”

Assignment Project Exam Help

What would Sipser do?

- Give the “proof idea”: Explain how to take machine(s) recognizing regular language(s) and create a new machine
- Explain in a few sentences why the construction works
- Give a formal description of the construction
- No need to formally prove that the construction works

Regular Expressions

Assignment Project Exam Help
<https://powcoder.com>

Add WeChat powcoder

Regular Expressions

- A different way of describing regular languages
- A regular expression expresses a (possibly complex) language by combining simple languages using the regular operations

Assignment Project Exam Help

<https://powcoder.com>

“Simple” languages: $\emptyset, \{\varepsilon\}, \{a\}$ for some $a \in \Sigma$

Add WeChat powcoder

Regular operations:

Union: $A \cup B$

Concatenation: $A \circ B = \{ab \mid a \in A, b \in B\}$

Star: $A^* = \{a_1 a_2 \dots a_n \mid n \geq 0 \text{ and } a_i \in A\}$

Regular Expressions – Syntax

A regular expression R is defined recursively using the following rules:

1. ε , \emptyset , and a are regular expressions for every $a \in \Sigma$

<https://powcoder.com>

2. If R_1 and R_2 are regular expressions, then so are
 $(R_1 \cup R_2)$, $(R_1 \circ R_2)$, and (R_1^*)

Examples: (over $\Sigma = \{a, b, c\}$)

$(a \circ b)$ $((((a \circ (b^*)) \circ c) \cup (((a^*) \circ b))^*))$ (\emptyset^*)

Regular Expressions – Semantics

$L(R)$ = the language a regular expression describes

1. $L(\emptyset) = \emptyset$
2. $L(\epsilon) = \{\epsilon\}$
3. $L(a) = \{a\}$ for every $a \in \Sigma$
4. $L((R_1 \cup R_2)) = L(R_1) \cup L(R_2)$
5. $L((R_1 \circ R_2)) = L(R_1) \circ L(R_2)$
6. $L((R_1^*)) = (L(R_1))^*$

Example: $L(((a^*) \circ (b^*))) =$

Simplifying Notation

- Omit \circ symbol: $(ab) = (a \circ b)$
- Omit many parentheses, since union and concatenation are associative:

$$(a \cup b \cup c) = (a \cup (b \cup c)) = ((a \cup b) \cup c)$$

Add WeChat powcoder

- Order of operations: Evaluate star, then concatenation, then union

$$ab^* \cup c = (a(b^*)) \cup c$$

Examples

Let $\Sigma = \{0, 1\}$

1. $\{w \mid w \text{ contains exactly one } 1\}$

Assignment Project Exam Help

<https://powcoder.com>

2. $\{w \mid w \text{ has length at least 3 and its third symbol is } 0\}$

Add WeChat powcoder

3. $\{w \mid \text{every odd position of } w \text{ is } 1\}$

Syntactic Sugar

- For alphabet Σ , the regex Σ represents $L(\Sigma) = \Sigma$

- For regex R , the regex $R^+ = RR^*$

Add WeChat powcoder

Regexes in the Real World

`grep` = globally search for a regular expression and print matching lines

```
guru99@guru99-VirtualBox:~$ cat sample|grep "a\+t"  
bat  
eat  
guru99@guru99-VirtualBox:~$
```

A terminal window screenshot with a dark background. The prompt is 'guru99@guru99-VirtualBox:~\$'. The command 'cat sample|grep "a\+t"' is entered. The output shows two lines: 'bat' and 'eat'. The text 'Assignment Project Exam Help' is overlaid in large red font across the middle of the terminal output.

Regular Expressions Describe Regular Languages

Theorem: A language A is regular if and only if it is described by a regular expression

Theorem 1: Every regular expression has an equivalent NFA

<https://powcoder.com>

Theorem 2: Every NFA has an equivalent regular expression

Add WeChat powcoder

Regular expression \rightarrow NFA

Theorem 1: Every regex has an equivalent NFA

Proof: Induction on size of a regex

Base cases: **Assignment Project Exam Help**

$$R = \emptyset$$

<https://powcoder.com>

Add WeChat powcoder

$$R = \varepsilon$$

$$R = a$$

Regular expression \rightarrow NFA

Theorem 1: Every regex has an equivalent NFA

Proof: Induction on size of a regex

What should the inductive hypothesis be?

- a) Suppose **some** regular expression of length k can be converted to an NFA
- b) Suppose **every** regular expression of length k can be converted to an NFA
- c) Suppose **every** regular expression of length **at most** k can be converted to an NFA
- d) None of the above

Regular expression \rightarrow NFA

Theorem 1: Every regex has an equivalent NFA

Proof: Induction on size of a regex

Inductive step: **Assignment Project Exam Help**

$$R = (R_1 \cup R_2)$$

<https://powcoder.com>
Add WeChat powcoder

$$R = (R_1 R_2)$$

$$R = (R_1^*)$$

Example

Convert $(1(0 \cup 1))^*$ to an NFA
