A (Real-Life?) Example

- **Example:** Kitchen scale
- P = Power button (ON / OFF)
- U = Units button (cycles through g / oz / lb)
Only works when scale is ON, but units remembered when scale is OFF
- Starts OFF in g mode
- **A computational problem:** Does a sequence of button presses in $\{P, U\}^*$ leave the scale ON in oz mode?

A DFA Recognizing Parity

The **language** recognized by a DFA is the set of inputs on which it ends in an “accept” state

Parity: Given a string consisting of a 's and b 's, does it contain an even number of a 's?

Assignment Project Exam Help

$\Sigma = \{a, b\}$ $L = \{w \mid w \text{ contains an even number of } a\text{'s}\}$
<https://powcoder.com>

Add WeChat powcoder

Which state is reached by the parity DFA on input aabab?

- a) “even”
- b) “odd”

Anatomy of a DFA

Some Tips for Thinking about DFAs

Given a DFA, what language does it recognize?

- Try experimenting with it on short strings. Do you notice any patterns?
- What kinds of inputs cause the DFA to get trapped in a state?

<https://powcoder.com>

Given a language, construct a DFA recognizing it

- Imagine you are a machine, reading one symbol at a time, always prepared with an answer
- What is the essential information that you need to remember? Determines set of states.

What language does this DFA recognize?

Practice!

- Lots of worked out examples in Sipser
- Tomorrow's discussion section

Formal Definition of a DFA

A **finite automaton** is a 5-tuple $M = (Q, \Sigma, \delta, q_0, F)$

Q is the set of states

Σ is the alphabet

$\delta: Q \times \Sigma \rightarrow Q$ is the transition function

$q_0 \in Q$ is the start state

$F \subseteq Q$ is the set of accept states

Assignment Project Exam Help

q_0		
q_1		

Start state q_0

Set of accept states $F =$

Formal Definition of DFA Computation

A DFA $M = (Q, \Sigma, \delta, q_0, F)$ **accepts** a string $w = w_1 w_2 \cdots w_n \in \Sigma^*$ (where each $w_i \in \Sigma$) if there exist $r_0, \dots, r_n \in Q$ such that

Assignment Project Exam Help

1. $r_0 = q_0$
 2. $\delta(r_i, w_{i+1}) = r_{i+1}$ for each $i = 0, \dots, n - 1$, and
 3. $r_n \in F$
- <https://powcoder.com>
Add WeChat powcoder

$L(M)$ = the **language** of machine M
= set of all strings machine M accepts
 M **recognizes** the language $L(M)$

Example: Computing with the Parity DFA

Let $w = abba$

Does M accept w ?

What is $\delta(r_2, w_3)$?

- a) q_0
- b) q_1

Assignment Project Exam Help

<https://powcoder.com>

A DFA $M = (Q, \Sigma, \delta, q_0, F)$ accepts a string

$w = w_1 w_2 \cdots w_n \in \Sigma^*$ (where each $w_i \in \Sigma$) if there exist $r_0, \dots, r_n \in Q$ such that

1. $r_0 = q_0$
2. $\delta(r_i, w_{i+1}) = r_{i+1}$ for each $i = 0, \dots, n - 1$, and
3. $r_n \in F$

Regular Languages

Definition: A language is **regular** if it is recognized by a DFA

$L = \{ w \in \{a, b\}^* \mid w \text{ has an even number of } a\text{'s} \}$ is regular

$L = \{ w \in \{0, 1\}^* \mid w \text{ contains } 001 \}$ is regular

Assignment Project Exam Help

<https://powcoder.com>

Many interesting programs recognize regular languages

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Let $TCPS = \{ w \mid w \text{ is a complete TCP Session} \}$

Theorem. TCPS is regular

Compilers

Comments :

Are delimited by `/* */`

Cannot have nested `/* */`

Must be closed by `*/`

`*/` is illegal outside a comment

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

COMMENTS = {strings over {0,1, /, *} with legal comments}

Theorem. **COMMENTS** is regular.

Genetic Testing

DNA sequences are strings over the alphabet $\{A, C, G, T\}$.

A **gene** g is a special substring over this alphabet.

Assignment Project Exam Help

A **genetic test** searches a DNA sequence for a gene.

<https://powcoder.com>

Add WeChat powcoder

GENETICTEST $_g$ = {strings over $\{A, C, G, T\}$ containing g as a substring}

Theorem. GENETICTEST $_g$ is regular for every gene g .

Arithmetic

$$\text{LET } \Sigma = \left\{ \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}, \right. \\ \left. \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \right\}$$

Assignment Project Exam Help

- A string over Σ has three ROWS ($\text{ROW}_1, \text{ROW}_2, \text{ROW}_3$)
- Each ROW $b_0 b_1 b_2 \dots b_N$ represents the integer

$$b_0 + 2b_1 + \dots + 2^N b_N.$$
- Let $\text{ADD} = \{S \in \Sigma^* \mid \text{ROW}_1 + \text{ROW}_2 = \text{ROW}_3\}$

Theorem. ADD is regular.

Nondeterministic Finite Automata

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Nondeterminism

In a DFA, the machine is always in exactly one state upon reading each input symbol

Assignment Project Exam Help

In a **nondeterministic** FA, the machine can try out many different ways of reading the same string

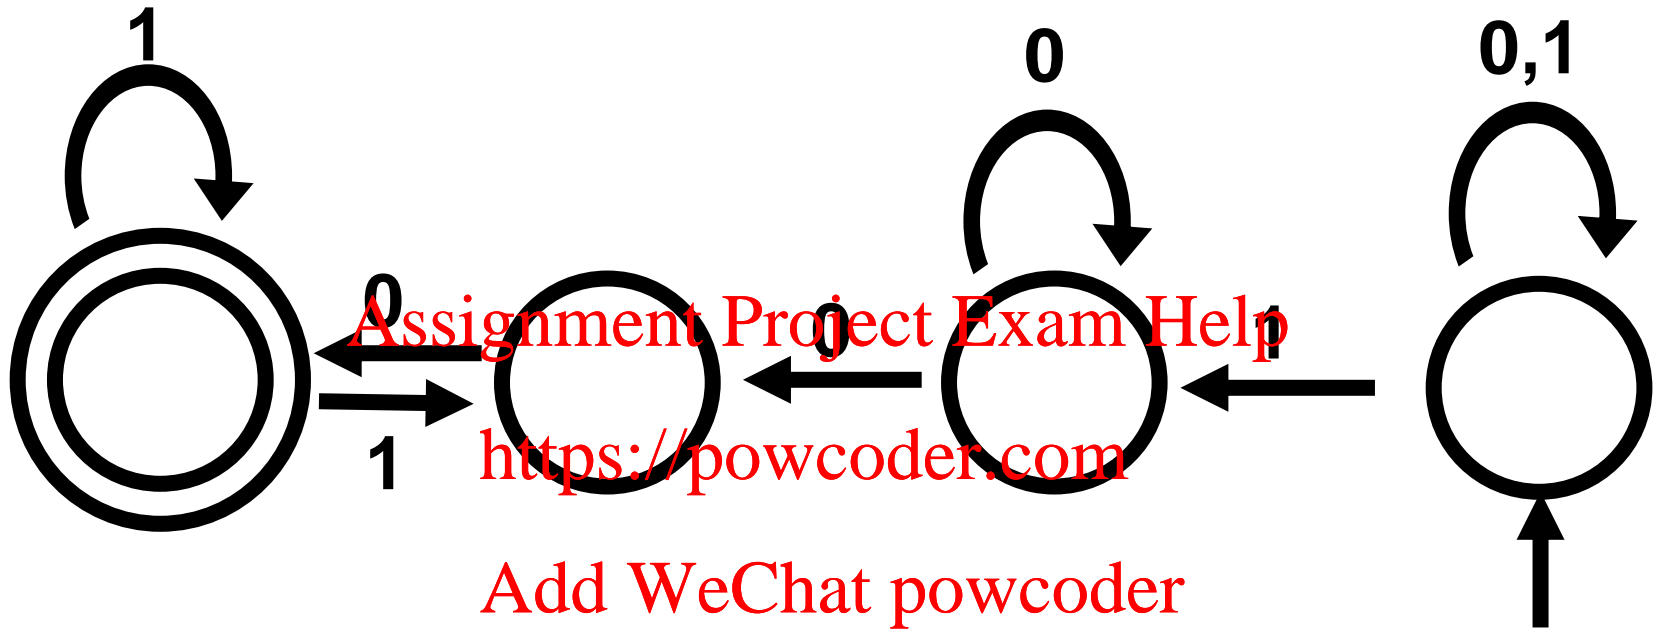

- Next symbol may cause an NFA to “branch” into multiple possible computations
- Next symbol may cause NFA’s computation to fail to enter any state at all

Nondeterminism

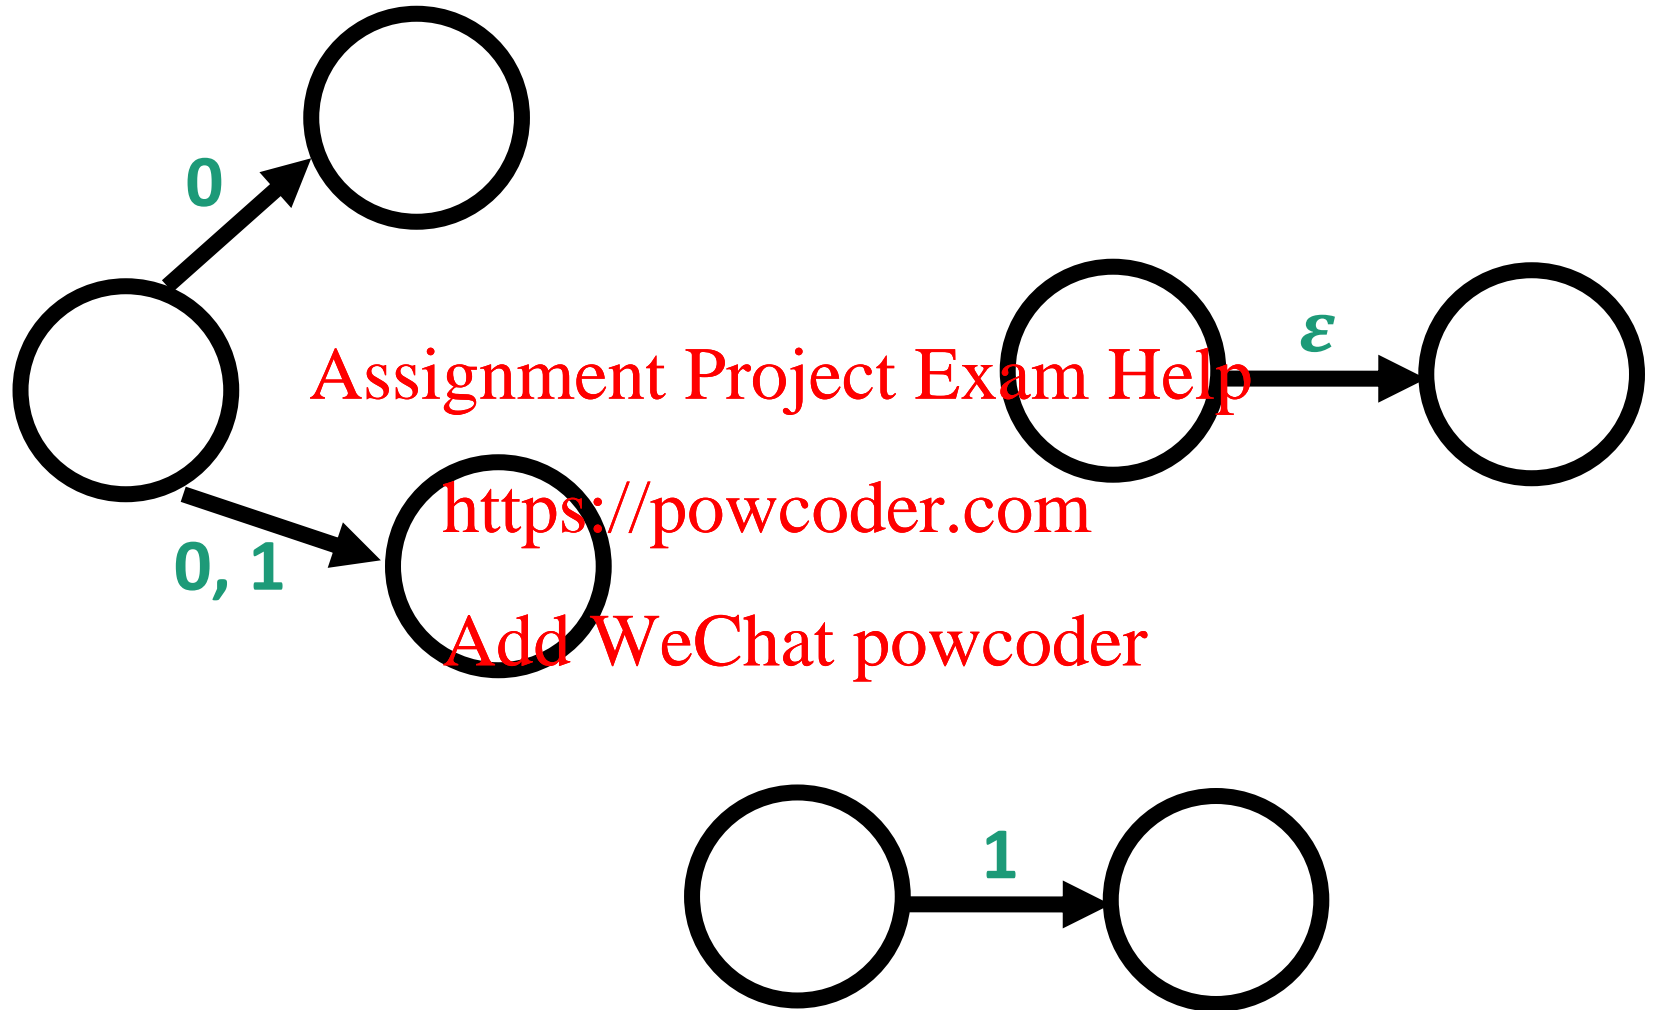

A **Nondeterministic Finite Automaton** (NFA) accepts if there *exists* a way to make it reach an accept state.

Nondeterminism

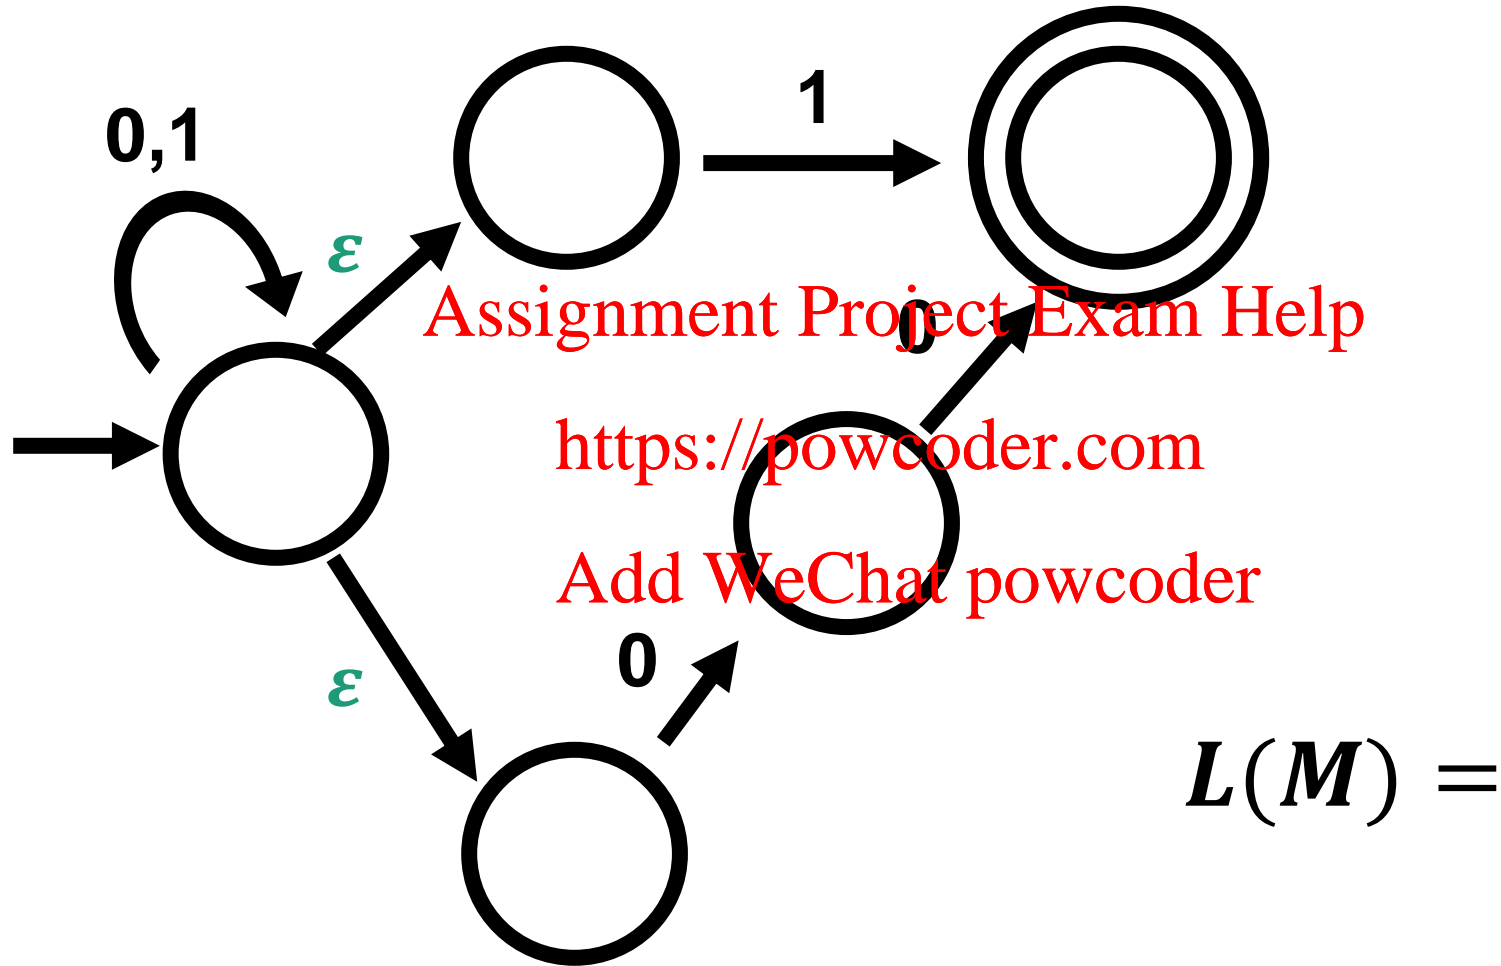

Example: Does this NFA accept the string 1100?

Some special transitions

Example

Example

Assignment Project Exam Help

Add WeChat powcoder

Now You Try!

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What is the language of this NFA? (over alphabet $\{0\}$)

- a) $\{0^k \mid k \text{ is a multiple of } 2\}$
- b) $\{0^k \mid k \text{ is a multiple of } 3\}$
- c) $\{0^k \mid k \text{ is a multiple of } 6\}$
- d) $\{0^k \mid k \text{ is a multiple of } 2 \text{ or a multiple of } 3\}$

Formal Definition of a NFA

An **NFA** is a 5-tuple $M = (Q, \Sigma, \delta, q_0, F)$

Q is the set of states

Σ is the alphabet

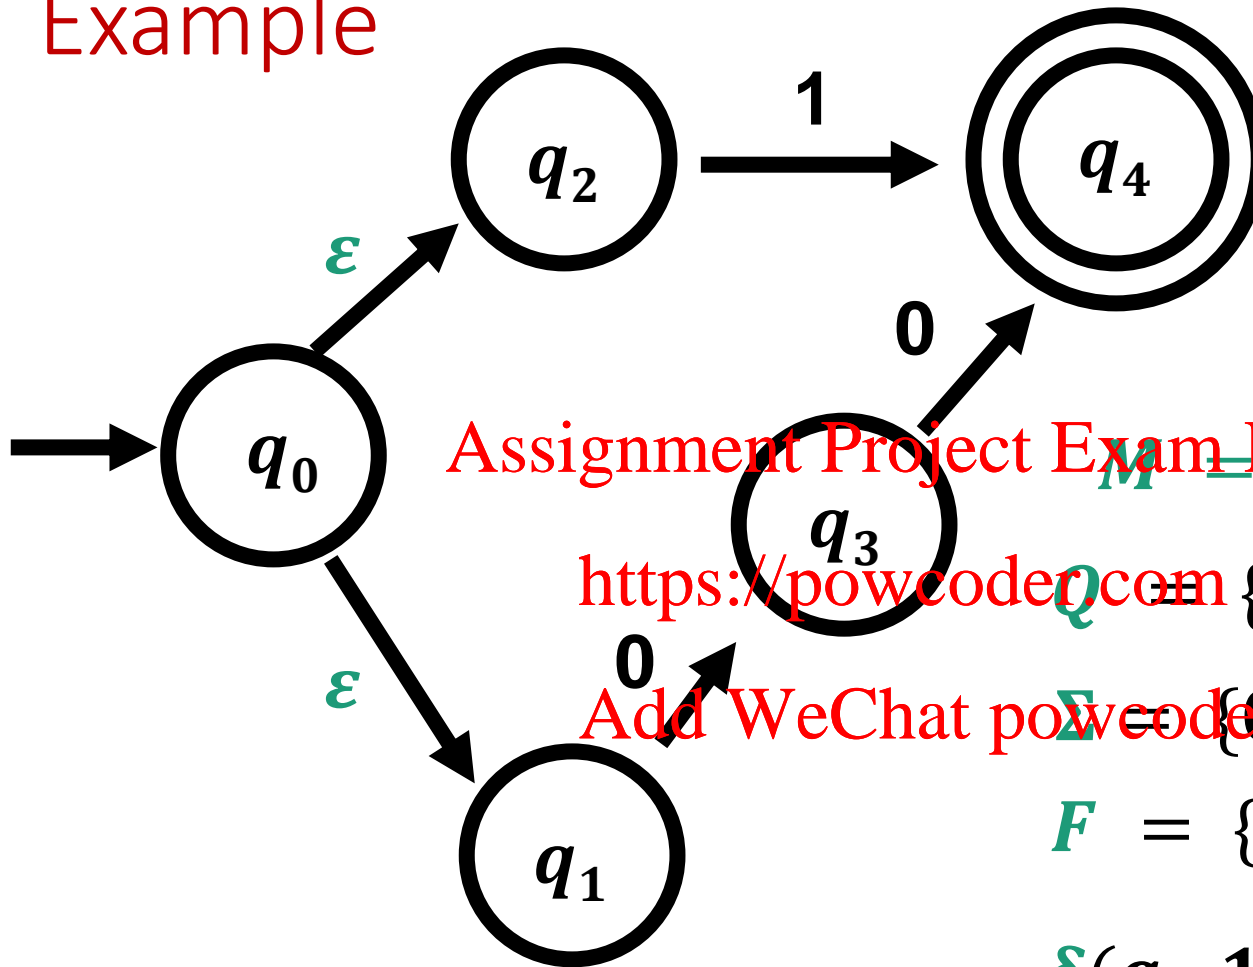

$\delta: Q \times \Sigma_\epsilon \rightarrow P(Q)$ is the transition function

$q_0 \in Q$ is the start state

$F \subseteq Q$ is the set of accept states

M **accepts** a string w if **there exists** a path from q_0 to an accept state that can be followed by reading w .

Example

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

$$M = (Q, \Sigma, \delta, Q_0, F)$$

$$Q = \{q_0, q_1, q_2, q_3, q_4\}$$

$$\Sigma = \{0, 1\}$$

$$F = \{q_4\}$$

$$\delta(q_2, 1) =$$

$$\delta(q_3, 1) =$$

Example

Add WeChat powcoder

$$N = (Q, \Sigma, \delta, q_0, F)$$
$$Q = \{q_0, q_1, q_2, q_3\}$$
$$\Sigma = \{0, 1\}$$
$$F = \{q_3\}$$
$$\delta(q_0, 0) =$$
$$\delta(q_0, 1) =$$
$$\delta(q_1, \epsilon) =$$
$$\delta(q_2, 0) =$$

accept or reject

Nondeterministic Computation

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

reject

accept

Ways to think about nondeterminism

- (restricted) parallel computation
- tree of possible computations
- guessing and verifying the “right” choice

Why study NFAs?

- Not really a realistic model of computation: Real computing devices can't actually try many possibilities in parallel

Assignment Project Exam Help

But:

<https://powcoder.com>

- Useful tool for understanding power of DFAs/regular languages
- NFAs can be simpler than DFAs
- Lets us study “nondeterminism” as a resource (cf. P vs. NP)
